C 0000016 mmmv folder structure for ID labeled artifacts t2

C 1..100

Related pages: C_0000007 mmmv_btreelike_folder_structure_t1

It's the same as the [mmmv_folder_structure_for_ID_labeled_artifacts_t1](#), except that the folders that contain an artifact also contain a folder that is named

<artifact file name>_artifact_record

The format of the contents of the artifact record folder is intentionally left unspecified by this specification.

Implementation Comments

If the artifact is a file, then the artifact name and its records folder name related parsing can be avoided by looking, which of them is a file and which of them is a folder. In the general case the parsing can be avoided by using 2 [mmmv_folder_structure_for_ID_labeled_artifacts_t1](#) instances: one for artifacts and another one for artifact record folders.
