How to Mount Windows Network Drives in WSL

Article ID: KB48568

Mount a Drive Until Logoff

1. Note the letter of the network drive that you would like to map in WSL.
We will use M: in this example.
2. Create a new folder for that drive letter under /mnt if it does not already exist. (ex: `mkdir /mnt/m`)
3. Mount the drive with `sudo mount -t drvfs M: /mnt/m`

Mount Drives in a Persistent Manner

1. Ensure the folder exists for the mount target (e.g. /mnt/m)
2. Open /etc/fstab and add a line such as the following:
`M: /mnt/m drvfs defaults 0 0`
3. Reload the fstab file with `sudo mount -a`
