WSL2: How to Fix "Virtual hard disk files must be uncompressed and unencrypted and must not be sparse"

Published Aug 26, 2020

I recently migrated from WSL 1 to WSL 2, which is simply a new version of the WSL architecture that changes how Linux distributions interact with Windows.

I was trying to set my WSL version with this command:

```
# Set Ubuntu distro to WSL 2
wsl --set-version Ubuntu-20.04 2
```

This resulted in the following error:

```
The requested operation could not be completed due to a virtual disk limitation.
Virtual hard disk files must be uncompressed and unencrypted and must not be sparse
```

In order to fix this, open up `File Explorer` and navigate to:

```
C:\Users\YOUR_USER\AppData\Local\Packages\CanonicalGroupLimited...
```

Right click on `LocalState`, then `Properties`, then `Advanced`.

Ensure `Compress contents to save disk space` and `Encrypt contents to secure data` are both **deselected**.

Click `OK`, then `Apply`, then `Apply changes to this folder only`

Voila. You're free to use `wsl --set-version`.
